Harmful Ingredients in Your Deodorant

Parabens

(methyl, ethyl, propyl, benzyl and butyl)

Parabens are a very common ingredient that is found in everyday cosmetic products and your deodorant as well. You may have seen “paraben free” labels, and it’s a good thing. So why is everyone so down on parabens after it has been used for nearly 70 years? **During a study** done in 2004, parabens have been linked to breast cancer. They are said to disturb the body’s hormonal balance and to mimic estrogen, as estrogen is said to play a part in breast cancer formation.

Dangers for health: linked to breast cancer.

Propylene Glycol

Propylene glycol is another common ingredient with health hazards. It may cause delayed allergic reactions, and is considered a neurotoxin, which may cause kidney and **liver damage**.

Dangers for health: delayed allergic reactions, possible kidney, and liver damage.

Aluminum compounds

(Aluminum chloralhydrate, aluminum zirconium tetrachlorohydrate gly)

Aluminum compounds within deodorants act as a plug within the sweat ducts and temporarily stop the flow of sweat. However, these compounds can be absorbed by your skin. Just as the parabens, **these compounds can mimic estrogen**, which promotes growth of breast cancer cells.

Dangers for health: linked to breast cancer.

Other ingredients:

Fragrance – skin irritation, harmful to the environment, allergies and organ system toxicity.
